

# STORMFORCE™

## Step 1. Connect keyboard and mouse.

Connect your keyboard and mouse via the USB ports on the back of the motherboard (the blue panel).

## Step 2. Connect the Display.

To enable you to receive a signal to your monitor/TV, identify what connector you will be using.

Connect your monitor to the graphics card (the green panel). The ports on the graphics card will be covered by small black caps  which will have to be removed before plugging in your cable.

If your system doesn't have a graphics card you will need to connect it to the motherboard (the blue panel).

## Step 3. Power up.

Plug in power cable (the yellow area) and press the power switch on the back from O to I. Place the system in an open, well-ventilated area.

Attach any wireless aerials if your system has a wireless card installed (the purple panel), otherwise connect your PC to your broadband router with an Ethernet cable (the blue panel).

If you have speakers/headphones the green port is for the audio output, and the pink port is for a microphone input, both are located on the motherboard (the blue panel).
